

## 6 WAYS **VALT CLOUD** MAXIMIZES YOUR PROGRAM'S IMPACT

See how a secure, cloud-based audio/video solution can improve outcomes more effectively than traditional, low-tech options.

Video has the power to improve learning, training, observation and understanding in many different fields.

But without a dedicated solution in place for audio/video capture, recording and collaboration, many professionals turn to DIY options, such as recording on an iPhone and uploading to a shared folder or drop box.

Because of their limited capabilities, these traditional solutions can't provide the same benefits as an A/V tool like VALT Cloud, which is built specifically to enable improved observation, training and collaboration.

## Traditional Solutions vs. VALT Cloud

	Traditional Solutions	VALT Cloud
Collaboration and Feedback	No way for users to leave markers or comments with feedback on the videos themselves	Built-in collaboration capabilities allow permissioned users to comment on and timestamp important moments in the video
Live Streaming	Traditional solutions only allow videos to be recorded, uploaded and watched later, not streamed in real time	Users can watch streaming videos in near-real time from anywhere with a browser and internet access
Video Organization	Requires manual effort to organize, search through and keep track of videos	Data tags, upload templates and powerful search functionality make it easy to find and organize videos
Customization	No customization capabilities for your program's specific needs	A team of implementation experts will tailor your VALT Cloud instance so you can use A/V capture exactly the way you want to
Security	No built-in privacy or security features, leaving your video data vulnerable to third parties	VALT Cloud protects your video data on a private and secure cloud server with advanced permission and password encryption features
Capture and Upload	Requires you to manually record, upload and file information via separate time-consuming processes	VALT Cloud instantly records and uploads content, then automatically indexes files

Often, the biggest benefit of DIY solutions is what they *don't* do, which is require large IT budgets or expensive, on-premises infrastructure.

Neither does VALT Cloud. Stream, record and upload video using your iPhone or Android, and access your VALT library from anywhere with an internet connection – it's that simple.
